Application No. 10/511,154

Amendment dated June 20, 2007

**AMENDMENTS TO THE CLAIMS** 

1. (Withdrawn) An equipment for transforming plants which comprises:

a microporous body having a surface on which a plant seed is germinated and

grown into a plant body, wherein the plant seed is germinated and grown by absorbing an

aqueous nutrition which is retained in communicating pores in the microporous body

from the surface of the microporous body; and

a carrier solution containing a gene with which the plant body is transformed,

wherein the grown plant body is transformed by immersing it in the carrier solution

according to an in planta method.

2. (Withdrawn) The equipment for transforming plants according to claim 1,

wherein the in plant method is a vacuum infiltration transformation.

3. (Original) A system for transforming plants which comprises:

a plurality of microporous bodies, each microporous body having a surface on

which a plant seed is germinated and grown into a plant body; and

a holding means for removably holding the plurality of microporous bodies,

Application No. 10/511,154
Amendment dated June 20, 2007

Reply to Office Action of March 20, 2007

Page 5 of 23

wherein each plant seed is germinated and grown by absorbing an aqueous

nutrition which is retained in communicating pores in the microporous body from the

surface of the microporous body,

wherein a plurality of plant bodies grown on the surfaces of the microporous

bodies held by the holding means are transformed by immersing them in a carrier

solution approximately at the same time according to an in planta method.

4. (Canceled)

5. (Previously presented) The system for transforming plants according to claim

3, wherein the aqueous nutrition is stored in a holding means with contacting with the

microporous bodies.

6. (Previously presented) The system for transforming plants according to claim

3, which further comprises a storage tank for storing the aqueous nutrition and an

aqueous nutrition-supplying means for connecting the microporous body with the

aqueous nutrition in the storage tank, wherein the aqueous nutrition in the storage tank is

supplied to the microporous body through the aqueous nutrition-supplying means.

,

Application No. 10/511,154

Amendment dated June 20, 2007

Reply to Office Action of March 20, 2007

7. (Previously presented) The system for transforming plants according to claim

3, wherein the microporous body has a cylindrical shape, and the plant seed is germinated

and grown on an inner surface of the microporous body.

8. (Canceled)

9. (Withdrawn) A method for transforming plants which comprises steps of:

germinating and growing a plant seed into a plant body on a surface of a

microporous body, wherein the plant seed is grown by absorbing an aqueous nutrition

retained in communicating pores in the microporous body from the surface of the

microporous body; and

transforming the plant body grown on the surface of the microporous body by

immersing it in a carrier solution containing a gene with which the plant body is

transformed according to an in planta method.

10. (Withdrawn) The method for transforming plants according to claim 9,

wherein the in planta method is a vacuum infiltration transformation.

11. (Withdrawn) A method for transforming plants which comprises steps of:

removably holding a plurality of microporous bodies in a holding means;

Page 7 of 23

Application No. 10/511,154

Amendment dated June 20, 2007

Reply to Office Action of March 20, 2007

seeding a plant seed on each surface of the microporous bodies, wherein the plant

seed is germinated and grown into a plant body by absorbing an aqueous nutrition

retained in communicating pores in the microporous body from the surface of the

microporous body; and

transforming a plurality of plant bodies grown on the surfaces of a plurality of the

microporous bodies held in the holding means by immersing them in a carrier solution

containing a gene with which the plant body is transformed approximately at the same

time according to an in planta method.

12. (Withdrawn) The method for transforming plants according to claim 11,

wherein the in planta method is a vacuum infiltration transformation.

13. (Withdrawn) The method for transforming plants according to claim 11,

which further comprises a step of selecting only microporous bodies having the plant

bodies which have grown to a stage suitable for transformation to hold them in the

holding means before immersing the plant bodies in the carrier solution, and subjecting

the plant bodies to transformation.

14. (Withdrawn) A method for selecting plants harboring a heterogeneous gene

from a parent transformed plant body, which comprises steps of:

Application No. 10/511,154
Amendment dated June 20, 2007

Reply to Office Action of March 20, 2007

Docket No. 0020-5309PUS1
Art Unit:1661
Page 8 of 23

(i) immersing a portion of a microporous body in an aqueous nutrition containing

one or more of the first drug for selection;

(ii) seeding a plant seed obtained from a transformed plant body on a surface of

the microporous body, wherein the transformed plant body has been transformed with at

least one heterogeneous gene comprising a resistant gene for the first drug for selection

and wherein the plant seed harboring the heterogeneous gene from a parent transformed

plant body can be germinated or grown by absorbing an aqueous nutrition containing the

first drug for selection retained in communicating pores in the microporous body from

the surface of the microporous body, but the plant seed harboring no heterogeneous gene

from a parent transformed plant body can not be germinated or grown; and

(iii) obtaining the plant body which can be germinated or grown or,

further, repeating above steps (i) to (iii) once or more times, using the plant seed obtained

from the plant body and one or more of the drug for selection which is the same as or

different from the first drug for selection in place thereof, wherein the transformed plant

body also comprises a resistant gene for the drug for selection.

15. (Withdrawn) A method for selecting plants harboring a heterogeneous gene

from a parent transformed plant body which comprises conducting, at least one time,

steps of:

Page 9 of 23

Application No. 10/511,154

Amendment dated June 20, 2007

Reply to Office Action of March 20, 2007

seeding a plant seed obtained in claim 14 harboring the resistant gene for the first

drug for selection on the surface of the microporous body, wherein the plant seed is

germinated and grown into a plant body by absorbing one or more of a drug for selection

different from the first drug for selection or the aqueous nutrition retained in

communicating pores in the microporous body from the surface of the microporous body;

and

confirming whether the grown plant body harbors the resistant gene for the drug

for selection different from the first drug for selection, or whether the grown plant body

expresses a target heterogeneous gene as phenotype thereof.

16. (Canceled)

17. (Currently amended) The system for transforming plants according to claim

4 claim 5, which further comprises a storage tank for storing the aqueous nutrition and an

aqueous nutrition-supplying means for connecting the microporous body with the

aqueous nutrition in the storage tank, wherein the aqueous nutrition in the storage tank is

supplied to the microporous body through the aqueous nutrition-supplying means.

18. (Canceled)

19. (Previously presented) The system for transforming plants according to claim 5, wherein the microporous body has a cylindrical shape, and the plant seed is germinated and grown on an inner surface of the microporous body.

- 20. (Previously presented) The system for transforming plants according to claim 6, wherein the microporous body has a cylindrical shape, and the plant seed is germinated and grown on an inner surface of the microporous body.
- 21. (New) The method according to claim 9, wherein the plants are selected from the group consisting of bishop's flower (Ammi majus), onion (Allium cepa), garlic (Allium sativum), celery (Apium graveolens), asparagus (Asparagus officinalis), sugar beet (Beta vulgaris), cauliflower (Brassica oleracea var. botrytis), Brussels sprout (Brassica oleracea var. gemmifera), cabbage (Brassica oleracea var. capitata), rape (Brassica napus), caraway (Carum carvi), chrysanthemum (Chrysanthemum morifolium), spotted hemlock (Conium maculatum), coptis Rhizome (Coptis japonica), chicory (Cichorium intybus), summer squash (Curcurbita pepo), thorn apple (Datura meteloides), carrot (Daucus carota), carnation (Dianthus caryophyllus), buckwheat (Fagopyrum esculentum), fennel (Foeniculum vulgare), strawberry (Fragaria chiloensis), soybean (Glycine max), hyacinth (Hyacinthus orientalis), sweet potato (Ipomoea batatas), lettuce (Lactuca sativa), birds-foot trefoil (Lotus corniculatus, Lotus japonicus), tomato
